Introduction

The Model 43-65-1 Beta Scintillator is a detector designed for beta radiation survey when used with a general purpose survey meter, ratemeter, or scaler instrument. It uses a 0.03 cm (0.01 in.) thick plastic scintillation material and a 3.8 cm (1.5 in.) diameter magnetically shielded photomultiplier tube.

The detector housing is constructed of aluminum alloy with beige powder coat for durability and easy maintenance. The detector window is protected by a 79% open, 20-gage stainless steel 0.64 cm (0.25 in.) hex screen. The detector will malfunction if the window is pierced or otherwise compromised. A plastic protective cover is provided to help protect the detector face when the instrument is not in use. In addition, the windows are replaceable in event of damage thereby increasing the working life of the detector.
